                                                                                                                                                                                  ABL49776 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of human DNA mismatch repair protein 11. The sequences are useful in the treatment of cancer, haemopathy, HIV infection, immunological diseases and of cancer, the present sequence is a probe for the coding sequence of the coding seque
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sapiens.

The present invention also described a method for preparing (I) using DNA recombination techniques. (I) and the polymuleotide encoding it can be used in the treatment of diseases such as cancer and human immunodeficiency virus (HIV) infection. The present sequence represents probe for human tyrosinase 10.34, which is used in an example from the

The present invention also described a method for preparing (I) using DNA recombination techniques. (I) and the polynucleotide encoding it can be used in the treatment of diseases such as cancer and human immunodeficiency virus (HIV) infection. The present sequence represents probe for human tyrosinase 10.34, which is used in an example from the

                                                                                                                                                                                                                           he present invention provides the protein and coding sequences of human protein subunit 9.02. The sequences can be used in the treatment of ancers, coughs, cardiac asthma, diarrhoea, constipation, colic, psychic isease and morphinic analgesic acute poisoning. The present sequence is probe used to isolate the coding sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    187

                                                                                                                                                                                                                                                                                                                              The present invention describes human tumour suppressor factor 11.77 (1). (1) has cytostatic, haemostatic, virucide, immunomodulatory and antiinflammatory activities. The polynucleotide (II) encoding (I) can be used in gene therapy. (I) and (II) can be used in the diagnosis and used the second of the diagnosis and the diagnosis and the second of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present sequence represents a probe for human tumour suppressor factor 11.77, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human tumor suppressor factor 11.77 and encoding polynucleotide, diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and

The oncogene protein 11.66 DNA and protein sequences are useful for treating malignant tumour, haemopathy, development disturbance, HIV infection, immunological disease and various inflammations. The present DNA sequence represents a probe that is specific for the gene sequence of the human oncogene protein 11.66
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mao
                                                                                                                                                                                                                                         Human oncogene

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises the amino acid and coding sequence of the human oncogene protein 11.66. The oncogene protein 11.66 DNA and protein sequences are useful for treating malignant tumour, haemopathy, development disturbance, HIV infection, immunological disease and various inflammations. The present DNA sequence represents a probe that is specific for the gene sequence of the human oncogene protein 11.66
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; drug metabolising enzyme; gene; drug metabolism; chromo polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction clinical trial; drug approval; single nucleotide polymorphism;
                                                                                                                                                                                                                                                                                                                                                                                                   Identifying individuals having a polymorphism, useful for determining effectiveness or side effect of a drug or treatment protocol, comprise detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       27-DEC-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC DNA sequence variations and human diseases, conditions, and responses to cc drugs. SNPs are also useful as polymorphism markers for discovering genes content on the above respects as they are stable in populations, cour cour frequently, and have lower mutation rates than other genome variations cc such as repeating sequences. The detection and analysis of polymorphisms cc in genes encoding drug metabolising enzymes allows the customisation of cdrug therapies based upon the genetic profile of individual patients. Cc fris would not only take the guesswork out of selecting the drug with the creduce the likelihood of adverse reactions, thereby increasing safety. Cc methods of the invention are also useful in the drug discovery and cc approval processes. For example, individuals could be selected for creabelle of responding to a particular drug ordrug class, and previously failed drug candidates could be revived if they were matched with more capable of responding to a particular drug ordrug class, and previously failed drug candidates could be revived if they were matched with more capable drug trials only it and decreases in the number of adverse drug class, and previously capable drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy xxx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches 36;

CC sequences ABZ43217-ABZ50887 represent polymorphic sites within genes CC encoding enzymes associated with drug metabolism. The invention relates CC one polymorphism in such drug metabolising enzyme-encoding genes. The CC one polymorphisms may be identified in a nucleic acid sample using probes or CC primers specific for a sequence selected from ABZ43217-ABZ50887 using a CC variety of detection assays, including hybridisation assays, mucleic acid carrays and PCR-based methods. The invention also encompasses methods of CC evaluating and screening drugs using genetic polymorphism data. particularly that relating to single nucleotide coloryphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between cc polymorphisms (SNPs), may be used in studying the relationship between cc polymorphisms (SNPs), may be used in studying the relationship between cc polymorphisms (SNPs), may be used in studying the relationship between cc that cause or exacerbate certain diseases, SNPs are particularly useful critical cause or exacerbate certain diseases, SNPs are particularly useful critical cause or exacerbate certain diseases, SNPs are particularly useful critical trials based upon the genetic profile of individual patients. CC drug therapias based upon the genetic profile of individual patients of this would not only take the genetic profile of individual patients. CC methods of the invention are also useful in the drug discovery and capable of the invention are also useful in the drug discovery and capable of responding to a particular functions, thereby increasing safety. CC capable of responding to a particular discovery capable of responding to a particular discovery capable of the invention may therefore lead to a an increase in the range of the invention may therefore lead to a an increase in the range of the invention may therefore the definition and the number of different contributions. The methods, data and compositions of the length of this patient medications a patient needs to take before finding an effective

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mao
                               The present invention discloses a polypeptide-guanosine triphosphatase activator protein-10.01. The invention also discloses the method for curing several diseases, such as squamobasal cell carcinoma of skin, osteosarcoma, leukemia and teratoma by using said polypeptide. The

                                                                                                                         The invention relates to human KIAA0608 protein 10.12 (ABP58674) and nucleic acids encoding it (ABZ57108). The protein has a molecular weight of 10 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. KIAA0608 protein 10.12 can be used in the treatment of a variety of diseases such as peptic ulcers and diabetes. Sequences ABZ57113-ABZ57114 represent human KIAA0608 protein 10.12 probes used in an exemplification of the

CC human gene encoding a protein (AURED), the meprin A, beta CC (CIS), the alanyl aminopeptidase P-like protein (XPN-BPI), the tissue CC (Rallikrein protein), the membrane bound aminopeptidase P protein (XPN-BPI), the tissue CC (Rallikrein protein), the tissue CC (Rallikrein protein), the membrane bound aminopeptidase P protein CC (GUCYIA2). The nucleic acid comprises at least one polymorphic position, cincluding the alleles, reference alleles and alternate alleles of the cCC single nucleotide polymorphisms, listed in the specification. The CC sequence of the gene. The polymorphic position residing in a coding position resides in a missense or silent mutation of the translated CC position resides within the untranslated region or an intronic region of the gene. Constructing haplotypes using the nucleic acids above further CC comprises using the haplotypes to identify an individual for the presence CC of a disease phenotype, and correlating the presence of the disease phenotype is angioedema or an angioedema -like disorder. The nucleic acids, primers and probes are CC useful in phenotype correlations, paternity testing, medicine and genetic CC analysis. The nucleic acids and polypeptides can be used in diagnosing, preventing or treating cardiovascular disease, e.g. angioedema, angina pectoris, hypertension, heart failure, myocardial infarction, aneurysm, stroke, embolism, thrombosis, coronary artery disease or cancer. The obstructive pulmonary disease, cough reflex, allergies, or cancer. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              meprin A beta protein; aminopeptidase P-like protein; XPM-PEPL; tissue kallikrein protein; KIKI; aminopeptidase p protein; MEPIB; soluble guanylate cyclase 1 alpha-2 subunit protein; GUCYIA2; haplotype; angioedema; angioedema-like disorder; paternity testing; cardiovascular diseases; angina pectoris; hypertension; heart failure; myocardial infarction; aneurysm; stroke; embolism; thrombosis; coronary artery disease; arteriosclerosis; hypersensitivity; haemodialysis; sepsis; inflammatory disease; inflammatory arthritis; asthma; chronic obstructive pulmonary disease; cough reflex; allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human single nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         specific location, useful in patern diagnosing, preventing or treating angioedema or angina pectoris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid comprising a single nucleotide polymorphism at a specific location, useful in paternity testing, genetic analysis of diagnosing, preventing or treating cardiovascular diseases e.g.

one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphism may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZASONET using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       27-DEC-2000; 2000JP-00399443

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC in the above respects as they are stable in populations, occur CC frequently, and have lower mutation rates than other genome variations CC such as repeating sequences. The detection and analysis of polymorphisms CC in genes encoding drug metabolising enzymes allows the customisation of in genes encoding drug metabolising enzymes allows the customisation of CC rates would not only take the guesswork out of selecting the drug with the CC greatest therapeutic effect for a particular patient, but would also creduce the likelihood of adverse reactions, thereby increasing safety. CC reduce the likelihood of adverse reactions, thereby increasing safety. CC detects the invention are also useful in the drug discovery and CC approval processes. For example, individuals could be selected for CC clinical trials only if their genetic profiles indicate that they are CC capable of responding to a particular drug or drug class, and previously CC failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of CC possible drug trargets and decreases in the number of adverse drug consible drug trargets and decreases in the number of adverse drug che length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy of the constitutions apatient needs to take before finding an effective therapy of the constitutions of the before finding an effective therapy of the constitutions of the before finding an effective therapy of the constitutions of the before finding an effective therapy of the constitutions apatient needs to take before finding an effective therapy of the constitutions of the before finding an effective therapy of the constitutions of the before finding an effective therapy of the constitutions of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

CC encoding enzymes associated with drug metabolism. The invention relates come polymorphism in such drug metabolising enzyme-encoding genes. The compositions for identifying individuals who have at least cone polymorphisms may be identified in a nucleic acid sample using probes or compilers specific for a sequence selected from ABZ4217-ABZ50887 using a covariety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of covariety of detection assays, including hybridisation assays, nucleic acid carrays and PCR-based methods. The invention also encompasses methods of covaluating and screening drugs using genetic polymorphism data. Genetic colymorphisms (SNPs), may be used in studying the relationship between compasses to drugs. SNPs are also useful as polymorphism markers for discovering genes to that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, and responses to that cause or exacerbate certain diseases. SNPs are particularly useful cin penes encoding drug metabolising enzymes allows the customisation of the genes of cover mutation rates than other genome variations of the invention are also useful an populations, occur in genes encoding drug metabolising enzymes allows the customisation of creduce the likelihood of adverse reactions, thereby increasing safety.

CC methods of the invention are also useful in the drug discovery and spiral processes. For example, individuals could be selected for approval processes. For example, individuals could be selected for capropriate partient populations. The methods, data and compositions of the invention may therefore lead to an increase in the range of the invention spiral trials are on methods, data and compositions of the invention are also methods. The number of adverse drug to be approved, the length of time patients are on medication and the number of different medications a patient people.
                                                                                                      Sequence '41

Thought to be cytostatic, antibacterial, immunosuppressive and antiinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side effects of surgery. The present sequence is an NTP encoding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 33

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human eukaryotic acetyl transferase 10 with cytostatic, virucidal, immunomodulatory, antiinflammatory and haemostati activity. The protein and encoding polynucleotide are used in diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The polynucleotide is useful in gene therapy. The present sequence is that of a probe, useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ā

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes concoding enzymes associated with drug metabolism. The invention relates cone polymorphism in such drug metabolising enzyme-encoding genes. The polymorphism is such drug metabolising enzyme-encoding genes. The cone polymorphism is such drug metabolising enzyme-encoding genes. The primers specific for a sequence selected from ABZ43217-ABZ50887 using a curaity of detection assays, including hybridisation assays, nucleic acid carrays and PCR-based methods. The invention also encompasses methods of CC evaluating and screening drugs using genetic polymorphism data. Genetic polymorphism data, particularly that relating to single nucleotide conformations and numan diseases. SNPs are lationship between CC polymorphism data, particularly that relating to single nucleotide conformations and numan diseases. SNPs are particularly genes to CC drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful circular cause or exacerbate certain diseases. SNPs are particularly useful circular states than other genome variations cour frequently, and have lower mutation rates than other genome variations cour genes encoding drug metabolising enzymes allows the customisation of drug therapies based upon the genetic profile of individual patients. CC frist would not only take the guessork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also course the likelihood of adverse reactions, thereby increasing safety. CC Methods of the invention are also useful in the drug discovery and secure and secure and secure and form of the guessor of the invention may therefore lead to an increase in the range of the invention of decreases in the methods, data and compositions of the invention may therefore lead to a mincrease in the range of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     27-DEC-2000;

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to detecting at least Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises 23; Page 102; one polymorphism in 2785pp; English or treatment protocol, the drug metabolizing enzyme ecid

are also useful as polymorphism markers

and responses to discovering gener

genes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations CC such as repeating sequences. The detection and analysis of polymorphisms CC in genes encoding drug metabolising enzymes allows the customisation of CC drug therapies based upon the genetic profile of individual patients. CC This would not only take the guesswork out of selecting the drug with the CC greatest therapeutic effect for a particular patient, but would also CC Methods of the invention are also useful in the drug discovery and CC approval processes. For example, individuals could be selected for CC clinical trials only if their genetic profiles indicate that they are CC capable of responding to a particular drug or drug class, and previously CC failed drug candidates could be revived if they were matched with more CC appropriate patient populations. The methods, data and compositions of CC possible drug targets and decreases in the number of adverse drug creations, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy or considerations a patient needs to take before finding an effective therapy or considerations a patient needs to take before finding an effective therapy or considerations and the number of different medications and the number of different medications and the number of different medications and the number of different medications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches 36;

CC sequences ABZ4317-ABZ50887 represent polymorphic sites within genes CC encoding enzymes associated with drug metabolism. The invention relates CC one polymorphism in such drug metabolising enzyme-encoding genes. The cone polymorphisms may be identified in a nucleic acid sample using probes or CC primers specific for a sequence selected from ABZ4327-ABZ50887 using a cC variety of detection assays, including hybridisation assays, nucleic acid carrays and PCR-based methods. The invention also encompasses methods of CC evaluating and screening drugs using genetic polymorphism data. Genetic CC polymorphism data, particularly that relating to single nucleotide colony sequence variations and human diseases, conditions, and responses to CC MANA sequence variations and human diseases. SNPs are particularly useful colony in the above respects as they are stable in populations, occur crequently, and have lower mutation rates than other genome variations cc in genes encoding drug metabolising enzymes allows the customisation of creduce the likelihood of adverse reactions, thereby increasing safety. This would not only take the genesure reactions, thereby increasing safety. Methods of the invention are also useful in the drug discovery and capable of responding to a particular partient, but would also approval processes. For example, individuals could be selected for capable of responding to a particular drug or drug class, and previously cfailed drug candidates could be revived if they were matched with more capacitions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different could be selected for a possible drug targets and decreases in the number of adverse of the therapy of the patients are on medication and the number of different the lands of the selections of the length of time patients are on medication and the number of different the patient is not take before finding an effective therapy the could be selected for an interest of diff
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                맑

                                                                                                                                                                                       colories and become thouse when the compasses methods of cevaluating and screening drugs using genetic polymorphism data. Genetic polymorphism data, particularly that relating to single nucleotide polymorphism data, particularly that the single nucleotide consumers of the cause or exacerbate as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations consumers of the sequences. The detection and analysis of polymorphisms of in genes encoding drug metabolising enzymes allows the customisation of drug therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. Consider the invention are also useful in the drug discovery and concesses. For example, individuals could be selected for capable of responding to a particular drug ordines that they are companied attended to a particular drug ordines, and previously failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to an increase in the range of consible drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
                                                                               Matches
                                                                                                                                                            Sequence 41
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABEA3217-ABE50887 using a variety of detection assays, including hybridisation assays, nucleic aci

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (SNP) "
```

CC to methods and compositions for identifying individuals who have at least come polymorphism in such drug metabolising enzyme-encoding genes. The CC polymorphisms may be identified in a nucleic acid sample using probes or CC primers specific for a sequence selected from ABZ43217-ABZ50887 using a CC variety of detection assays, including hybridisation assays, nucleic acid CC arrays and PCR-based methods. The invention also encompasses methods of CC evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide CC polymorphism data, particularly that relating to single nucleotide CC polymorphism data, particularly that relating to single nucleotide CC polymorphism screening drugs using genetic polymorphism data desponses to CC drugs. SNPs are also useful as polymorphism markers for discovering genes (CC drugs. SNPs are also useful as polymorphism markers for discovering genes (CC drugs. SNPs are particularly useful compasses and processes as they are stable in populations, occur (CC frequently, and have lower mutation rates than other genome variations (CC drug therapies based upon the genetic profile of individual patients. (CC drug therapies based upon the genetic profile of individual patients. (CC drug therapies based upon the genetic profile of individual patients. (CC drug the invention are also useful in the drug discovery and (CC capable of responding to a particular patient, but would also (CC capable of responding to a particular genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously (CC failed drug candidates could be revived if they were matched with more compositions of time patient sare on medication and the number of different the length of time patients are on medication and the number of different consolidations. The methods, data and compositions of the length of times and decreases in the number of adverse drug consolidations.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SXS
Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes cancoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a covariety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of carrays and PCR-based methods. The invention also encompasses methods of collusting and screening drugs using genetic polymorphism data. particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between CC polymorphisms (SNPs), may be used in studying the relationship between CC polymorphisms useful as polymorphism markers for discovering genes to drugs. SNPs are also useful as polymorphism markers for discovering genes chat cause or exacerbate certain diseases. SNPs are particularly useful cc in the above respects as they are stable in populations, occur
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; single nucleotide polymorphism; SNP; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; drug metabolising enzyme; gene; drug metabolism; chromosome polymorphic site; drug evaluation; drug screening; genotyping;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ge such as repeating sequences. The detection and analysis of polymorphisms of genes encoding drug metabolising enzymes allows the customisation of drug therapies based upon the genetic profile of individual patients. On this would not only take the guesswork out of selecting the drug with the order of the invention of a particular patient, but would also creduce the likelihood of adverse reactions, thereby increasing safety. On the drug of the invention are also useful in the drug discovery and capproval processes. For example, individuals could be selected for composed trials only if their genetic profiles indicate that they are capable of responding to a particular drug order class, and previously capable of responding to a particular drug order class, and previously capable of responding to a particular drug order capable of responding to a particular drug order class, and previously creations, failed drug chalations. The methods, data and compositions of the invention may therefore lead to an increase in the range of cossible drug targets and decreases in the number of adverse drug chalations a patient sare on medication and the number of different medications a patient needs to take before finding an effective therapy of the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes ce encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least cone polymorphism in such drug metabolism. The invention relates core primers specific for a sequence selected from ABZ43217-ABZ50887 using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a covariety of detection assays, including hybridisation assays, nucleic acid carrays and pCR-based methods. The invention also encompasses methods of cevaluating and screening drugs using genetic polymorphism data. Genetic polymorphism data, particularly that relating to single nuclectide polymorphism data, particularly that relating to single nuclectide complymorphism data particularly that relating to single nuclectide complymorphism data. Genetic polymorphism data responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful finite cause or exacerbate certain diseases. SNPs are particularly useful can be perfected by any populations, occur frequently, and have lower mutation rates than other genome variations can be encoding drug metabolising enzymes allows the customisation of carry therefore based upon the genetic profile of individual patients. The detection and analysis of polymorphisms can repeat upon the genetic profile of individual patients. The methods of the invention are also useful in the drug discovery and capable of the invention are also useful in the drug discovery and capable of responding to a particular posities indicate that they are capable of responding to a particular profiles indicate that they are capable of responding to a particular profiles indicate that they are capable of responding to a particular drug or drug class, and previously capacitions, is also drug trialed drug trialed drug trialed for the methods, data and compositions of the inventions. The 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

CC variety of detection assays, including hybridisation assays nucleic acid contrarys and PCR-based methods. The invention also encompasses methods of CC evaluating and screening drugs using genetic polymorphism data. Genetic polymorphism data, particularly that relating to single nucleotide cCC polymorphism (SNPs), may be used in studying the relationship between CC drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases, conditions, and responses to frequently, and have lower mutation rates than other genome variations cCC in genes encoding drug metabolising enzymes allows the customisation of CC drug therapies based upon the genetic porofile of individual patients. CCC This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also creduce the likelihood of adverse reactions, thereby increasing safety. CC capable of responding to a particular drug or drug discovery and CC capable of responding to a particular drug or drug class, and previously failed drug targets and decreases in the methods, data and compositions of cups that they are particular genetic profiles indicate that they are appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of compositions failed drug trials, the time taken for a drug to be approved, the length of time patients are as methods and the number of different reads to take before finding an effective therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             27-DEC-2000; : 02-MAY-2001; : 27-AUG-2001; :
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2002-583571/62.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         27-DEC-2001;
                                         medications a patient needs to take before finding an effective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 23; Page 129; 2785pp; English.

CC encoding enzymes associated with drug metabolism. The invention relates cc to methods and compositions for identifying individuals who have at least cone polymorphism in such drug metabolising enzyme-encoding genes. The polymorphism in such drug metabolising enzyme-encoding genes. The cc primers specific for a sequence selected from ABZ43217-ABZ50887 using a cc variety of detection assays, including hybridiaation assays, mucleic acid carrays and pCR-based methods. The invention also encompasses methods of cc evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide cc polymorphism (aNPs), may be used in studying the relationship between cc polymorphisms (SNPs), may be used in studying the relationship between cc polymorphisms (SNPs), may be used in studying the relationship between cc palymorphisms (SNPs), may be used in studying the relationship between cc respects as they are stable in populations, and responses to compasses methods of the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations such mass repeating sequences. The detection and analysis of polymorphisms cc in genes encoding drug metabolising enzymes allows the customisation of creduce the likelihood of adverse reactions, their patient, but would also creduce the likelihood of adverse reactions, thereby increasing safety. Cc methods of the invention are also useful in the drug discovery and apreviously creasing to a particular drug or drug class, and previously falled drug candidates could be revived if they were matched with more capable drug candidates could be revived if they were matched with more capactons, failed drug trials only trials on medication and the number of different medications a patient needs to take before finding an effective therapy of the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; drug metabolising enzyme; gene; drug metabolism; polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; single nucleotide polymorphism; SNP; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nakamura Y,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         27-DEC-2000; 2000JP-00399443

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  repair protein 10. The polypeptide can be used for screening mimics, agonists, antagonists or inhibitors, or in peptide fingerprinting identification. The polymucleotide can be used as primers for nucleic acid amplification reactions, as probes for hybridisation reactions, or in producing gene chips or microarrays. Drug compositions, which contain the polypeptide, polymucleotide, mimics, agonists, antagonists, inhibitors and their preparations, can be used treatment and diagnosis of diseases relating to the polypeptide. In particular, the polypeptide and encoded polynucleotide are applicable. In diagnosis and treatment of malignancy, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present sequence

comparison the alanyl aminopeptidase protein (ANPER), the malanyl aminopeptidase protein (ANPER), the membrane bound aminopeptidase Portein (XPN-PEPL), the tissue (CRIS), the alanyl aminopeptidase Portein (ANPER), the meprin A, beta (CRIS), the alanyl aminopeptidase Portein (XPN-PEPL), the tissue (CRIS), the meprin A, beta (CRIS), the meprin A (CRIS), the membrane bound aminopeptidase protein (CRIS), the alleles, reference alleles and alternate alleles of the crisical polymorphic position and alternate alleles of the crisical polymorphic position residing the polymorphic position residing the polymorphic position residing in a non-coding (CRIS), the gene. The polymorphic position residing in a non-coding (CRIS), the gene. Cristophenotype of polymorphic position residing in a non-coding (CRIS) and the presence of the gene. Cristophenotype, and correlating the nucleic acids above further (CRIS) and the haplotypes to identify an individual for the presence of a disease phenotype, and correlating the presence of the disease phenotype is anyloedema or an angioedema-like disorder. The nucleic acids, primers and probes are useful in phenotype correlations, paternity testing, medicine and genetic analysis. The nucleic acids and polypeptides can be used in diagnosing, percorris, hypertension, heart failure, myocardial infarction, aneurysm, cristophenotype in the membrane or anteriosclerosis, hypersensitivity reactions during haemodialysis, espesia, inflammatory diseases, cough reflex, allergies, or cancer. The presente a human single nucleotide polymorphism (SNP) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid comprising a single nucleotide polymorphism at specific location, useful in paternity testing, genetic analysis diagnosing, preventing or treating cardiovascular diseases e.g. angioedema or angina pectoris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cardiovascular diseases; angina pectoris; hypertension; heart myocardial infarction; aneurysm; stroke; embolism; thrombosis;

The invention relates to an isolated nucleic acid (I) derived from a human gene encoding a protein, such as the Cl, S subcomponent protein (CIS), the alanyl aminopeptidase protein (ANPEP), the meprin A, beta protein (MEPIB), the aminopeptidase P-like protein (XPN-PEPL), the tissue kallikrein protein (KUKI), the membrane bound aminopeptidase P protein (XPNPEP)), or the soluble guanylate cyclase 1, alpha-2 subunit protein (GUCYLA2). The nucleic acid comprises at least one polymorphic position, including the alleles, reference alleles and alternate alleles of the single nucleotide polymorphisms, listed in the specification. The polymorphic position resides in a (non)coding position within the genomic sequence of the gene. The polymorphic position residing in a coding position results in a missense or silent mutation of the translated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human single nucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                position resides within the unitranslated region or an intronic region of the gene. Constructing haplotypes using the nucleic acids above further comprises using the haplotypes to identify an individual for the presence of a disease phenotype, and correlating the presence of the disease compensation of the disease phenotype with the haplotype. The disease phenotype is angioedema or an angioedema-like disorder. The nucleic acids, primers and probes are considered in phenotype correlations, paternity testing, medicine and genetic analysis. The nucleic acids and polypeptides can be used in diagnosing, correcting or treating cardiovascular diseases, e.g. angioedema, angina conjunctions, heart failure, myocardial infarction, aneurysm, stroke, embolism, thrombosis, coronary artery disease or arteriosclerosis, hypersensitivity reactions during haemodialysis, cobstructive pulmonary disease, inflammatory arthritis, asthma, chronic obstructive pulmonary disease, cough reflex, allergies, or cancer. The present sequence represents a human single nucleotide polymorphism (SNP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  covariety of detection assays, including hybridisation assays, nucleic acid covariately of detection assays, including hybridisation assays, nucleic acid covariates and pore-based methods. The invention also encompasses methods of covariating and screening drugs using genetic polymorphism data. Genetic polymorphism (SNPs), may be used in studying the relationship between CC DNA sequence variations and human diseases, conditions, and responses to citat cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur crequently, and have lower mutation rates than other genome variations in genes encoding drug metabolising enzymes allows the customisation of cour drug theraptes based upon the genetic profile of individual patients.

Compared the likelihood of adverse reactions, thereby increasing safety. This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also concesses. For example, individuals could be selected for clinical trials only if their genetic profiles indicate that they are appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a mincrease in the range of compositions of the invention synthericals they were matched with more appropriate patient populations. The methods, data and compositions of the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁

          The present invention describes human GASC1 (gene amplified in squamous cell carcinoma 1). GASC1 has been located to the p23-24 region of human chromosome 9. GASC1 can be used in the diagnosis and investigation of diseases with which cell differentiation and proliferation are associated, such as cancer. It can also be used in gene therapy of these diseases; and screening substances for their ability to modify the expression of GASC1 and for use as drugs. The present sequence represents a PCR primer for human GASC1, which is used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   particular, probes to diagnose Prader-Willi/Angelman Syndrome were identified. The majority of PWS/Angelman patients are deleted for a common set of markers including ML34, IR4-3R, TD189-1 and TD3-21. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           amplify DNA from yeast artificial chromosomes as part of a cloning procedure to isolate probes for specific chromosomal abnormalities.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                     Primer PDJ34 is one of several primers which are preferred for use in amplifying inter-Alu regions of DNA. The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can be used to detect genetic variation. See AAQ27389-Q27404 and AAQ33141-Q33144. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                           WPI;
                                                                                                                                                                                                                                                                                                              Detection of genetic variation by 2-D electrophoresis of fragments hybridisation with labelled probes, carried out on fragments consi of inter-repeat sequences generated by PCR.
                                                                                                                                                                                                                                                                                                                                                                                Uitterlinden AG,

New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related disorders.

Claim 11; SEQ ID NO 359; 159pp; English.

Creat 20 but not more than 1500 consecutive nucleotides of the optineurin comprashly linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter coperably linked to a heterologous nucleic acid, a nucleic acid capable of cetecting a single nucleotide polymorphism (SNP) in the optineurin promoter promoter, a host cell comprising the promoter operably linked to a compression of the optineurin gene, associated with a sample containing a SNP sequence variation in a sample containing a SNP sequence variation in a sample containing DNA, detecting a SNP sequence variation in a sample containing bus of visual field in a patient (or the severity corporatesistion primers that direct amplification reaction primers that direct amplification reaction primers that direct amplification a sample containing the DNA) and detecting a polymorphism cobatining a sample containing the DNA) and detecting a polymorphism cobatining a sample containing the DNA) and detecting a polymorphism of capable of detecting a SNP located within an optineurin promoter, and detecting the polymorphism). The invention is used to diagnose and corporate sequence is an optineurin promoter motif, repeat element or present sequence is an optineurin promoter motif, repeat element or containing the primer motif, repeat element or put attitute regulatory region.

The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a polymorphic site described in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side effects of surgery. The present sequence is an NTP encoding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   referred to as cell death peptide. Thought to be cyroscart, referred to as cell death peptide. Thought to be cyroscart, antibacterial, immunosuppressive and antiinflammatory. It is useful for antibacterial, immunosuppressive and antiinflammatory. It is useful for antibacterial, immunosuppressive and antiinflammatory.

This enhancer element is derived from the flanking region of the human epithelial cell cytokeratin-8 gene. (Updated on 25-MAR-2003 to correct PN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 kidney disease, hereditary spherocytosis, von Willebrands disease, tuberous sclerosis, hereditary hemorrhagica telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, a acute intermittent porphyria. The polymorphic forms can also be used forensics to identify individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            regimes customized to underlying abnormalities. The polymorphisms can be used for association studies for hypertension, and in hypertension diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a polymorphism in the disease, and this can be used to identify potential drugs which combat the disease, and this can be used to identify potential drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabrys disease, familial hypercholesterolemia, polycystic video. Fabrys disease, familial hypercholesterolemia, polycystic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides polymorphic fragments of genes associated with hypertension. The nucleic acids including the polymorphic sites can be used as probes or primers for expressing variant proteins. Detection of the polymorphisms is useful in designing prophylactic and therapeutic the polymorphisms is useful in designing prophylactic and therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page 43;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hypertension
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel nucleic acids containing polymorphisms used in the diagnosis

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPB) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the disponucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a mucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
                                                                               inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific
                                                                                                                                                                     agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, musculidystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermitent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1; Page 53; 83pp; English

The base occupying the polymorphic site indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in a method for determining polymorphic forms in an individual. The invention further provides computer-readable storage medium for storing data for access by an application programme being executed on a data processing system. Such a method comprises a data structure stored in the computer-readable storage medium, the data structure including information resident in a database used by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    application programme and including records, each record comprising information identifying a polymorphism shown in the above sequences. products and methods can be used for analysing polymorphic sites in individuals for testing for the presence of a disease phenotype or in forensics, paternity testing or genetic mapping of phenotypic traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAQ27389 standard; DNA; 32
                        primer PDJ33A is one of several primers which are preferred for use in amplifying inter-Alu regions of DNA. The amplified fragments are then subjected to 2-D electrophoresis on the basis of length and differences in base sequence. The resulting separation pattern is transferred to a filter for screening with a probe. The method can be used to detect genetic variation. See also AAQ27390-Q27404 and AAQ33141-Q33144. (Update on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    25-MAR-2003

                                      The invention relates to an isolated nucleic acid (N1) comprising at CC least 20 but not more than 1500 consecutive nucleotides of the optineurin CC promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of CC detecting a single nucleotide polymorphism (SNP) in the optineurin CC promoter, a host cell comprising the promoter operably linked to a CC heterologous sequence, diagnosing or prognosing glaucoma in a sample CC obtained from a cell or bodily fluid (comprising detecting a polymorphism CC in a promoter region of the optineurin gene, associated with a glaucoma CC phenotype), detecting a SNP sequence variation in a sample containing DNA, determining the presence or increased CC in a sample containing DNA, determining the presence or increased CC disorder resulting in loss of visual field in a patient (or the severity or progression of glaucoma or to a progressive ocular hypertensive CC amplification reaction primers that direct amplification of a selected containing a sample containing the variation within the optineurin obtaining a sample containing the variation within the optineurin compaties of detecting a SNP located within an optineurin promoter, and comprising of detecting a SNP located within an optineurin promoter, and detecting a providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and companies and the providing and companies and the providing and comprising of the providing and providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides the protein and coding sequences of a number of ovarian and breast antigens. These are shown in AAI62467-AAI62572 and AAM42240-AAM42345. The sequences can be used in the diagnosis, prevention and treatment of breast and ovarian cancers, and their metastasses. The present sequence is a genomic sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                       The invention relates to a novel HOMO glandulae mammaria susceptibility gene encoding protein 12.32. The protein can be expressed by standard recombinant methodology. The protein and encoding polynucleotides are used in diagnosis and treatment of embryo peroplasia and cancer. The present sequence represents the HOMO glandulae mammaria susceptibility protein 12.32 cDNA cloning PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention
Sequence 33
                                                                                                                                              A novel HOMO glandulae mammaria susceptibility gene encoding protein 12.32, and its polynucleotide, useful in the diagnosis and treatment embryo peroplasia and cancer.
                                                                                                                                                                                                                                Mao

                                                                                                                                                                                                                                                                     The present invention relates to a neural thread protein (NTP) peptide referred to as cell death peptide. Thought to be cytostatic, antibacterial, immunosuppressive and antiinflammatory. It is useful for treating a condition in a patient requiring removal or destruction of cells, for treating a condition such as benign or malignant tumor, inflammatory disease, autoimmune disease and infectious disease. The peptide useful for treatment is derived from the amino acid sequence for a pancreatic thread protein. The peptide is conjugated, linked or bound to a molecule chosen from antibody or its fragment, antibody-like binding molecule, where the molecule has a higher affinity for binding to a tumor or other target than binding to other cells. Treatment using NTP peptides can remove benign tumors with less risk and fewer of the undesirable side
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           19-JUL-2001; 2001US-0306150P.

The invention provides polymorphic fragments of genes associated with CC hypertension. The nucleic acids including the polymorphic sites can be CC used as probes or primers for expressing variant proteins. Detection of CC the polymorphisms is useful in designing prophylactic and therapeutic CC regimes customized to underlying abnormalities. The polymorphisms can be CC used for association studies for hypertension, and in hypertension of CC diagnostic assays. Where the polymorphisms have strong correlation with CC hypertension. This information can be used to find the precise role in CC hypertension. This information can be used to find the precise role of a CC polymorphism in the disease. The polymorphisms can be tested for CC drugs which combat the disease. The polymorphisms can be tested for CC association with other diseases e.g. agammaglobulinemia, diabetes CC insipidus, Lesch-Nyhan syndrome, muscular dystrophy, wiskott-Aldrich CC syndrome, Fabrys disease, familial hypercholesterolemia, polycystic C tuberous sclerosis, hereditary spherocytosis, von Willebrands disease, familial cc colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and CC acute intermittent porphyria. The polymorphic forms can also be used in CC forensics to identify individuals
                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                 regimes customized to underlying abhormalities. The polymorphisms can be CC used for association studies for hypertension, and in hypertension with diagnostic assays. Where the polymorphisms have strong correlation with hypertension, within a gene, they are likely to have a causative role in hypertension. This information can be used to find the precise role of a golymorphism in the disease, and this can be used to identify potential CC drugs which combat the disease. The polymorphisms can be tested for association with other diseases e.g. agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich cyndrome, Fabrys disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrands disease, tuberous sclerosis, hereditary spherocytosis, von Willebrands disease, colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, and corrensics to identify individuals
